Corwin Siemensky

Problem 1: Cyclic Rotation

```
START
FUNCTION solution (A, K)
  repeat K times
    set Temp to last element in A
    FOR each element in A
      set current element to previous element
    END FOR
    set first element in A to Temp
  END loop
  RETURN A
END
```

Problem 2: Odd Occurences In Array

```
START
FUNCTION solution (A)
  set Unpaired to 0
  Isolate the upaired number and store in Unpaired
  RETURN Unpaired
END
```

Problem 3: Perm Missing Element

```
START
FUNCTION solution (A)
  Calculate expected sum of A
  Calculate actual sum of A
  set missing number to expected sum - actual sum
  RETURN missing number
END
```

Corwin Slemensky

Problem 4: Tape Equilibrium

```
START
FUNCTION solution(A)
  Calculate total sum of A
  loop through A
  Find current difference
    IF current difference < minimum difference THEN
      minimum difference = current difference
  END Loop
  RETURN minimum difference
END
```

Problem 5: Permutation Check

```
START
FUNCTION solution(A)
  Create a unique elements set
  Calculate expected sum
  Calculate actual sum
  Check for duplicates
  IF number out of range or duplicate THEN
    RETURN 0
  IF actual sum == expected sum THEN
    RETURN 1
  ELSE
    RETURN 0
END
```
